

PRACTICAL EXERCISE: BASTION HOST SETUP AND WINDOWS EC2 INSTANCE SETUP

Scenario 1

Your organization wants a secure Linux server in a public subnet to test SSH access and network configuration.

Objectives

- 1- Launch a Linux EC2 instance in a public subnet. 2- Assign a key pair and public IP address.
- 3- Configure a Security Group to allow SSH (port 22) only from your IP. 4- Ensure the subnet has a route to an Internet Gateway.
- 5- SSH into the instance from your local machine. 6- Enable CloudWatch Logs for SSH activity.
- 7- Automate the setup using a Launch Template or CloudFormation

Scenario 2

You need to deploy a Windows Server instance in AWS for testing administrative tasks. The instance can have public internet access.

Objectives

- 1- Launch a Windows Server EC2 instance in any subnet.
- 2- Assign a key pair for administrator password decryption.
- 3- Configure a Security Group to allow RDP (port 3389) from your IP. 4- Obtain the administrator password from the AWS Console.
- 5- Connect using Remote Desktop (RDP) to verify access.
- 6- Automate the deployment using a Launch Template or CloudFormation
